Motivation CI/CD: WFM (*Works For Me*)

Virtualisierung: Container vs. VM

Getting started

- DockerHub: fertige Images => hub.docker.com/search
- Image downloaden: `docker pull <IMAGE>`
- Image starten: `docker run <IMAGE>`

Beispiele

```
docker pull debian:stable-slim
docker run --rm -it debian:stable-slim /bin/sh
```

```
docker pull eclipse-temurin:latest
docker run --rm -v "$PWD":/data -w /data eclipse-temurin:latest javac Hello.java
docker run --rm -v "$PWD":/data -w /data eclipse-temurin:latest java Hello
```

Images selbst definieren

```
FROM debian:stable-slim

ARG USERNAME=pandoc
ARG USER_UID=1000
ARG USER_GID=1000

RUN apt-get update && apt-get install -y --no-install-recommends \
    apt-utils bash wget make graphviz biber \
    texlive-base texlive-plain-generic texlive-latex-base \
    #
    && groupadd --gid $USER_GID $USERNAME \
    && useradd -s /bin/bash --uid $USER_UID --gid $USER_GID -m $USERNAME \
    #
    && apt-get autoremove -y && apt-get clean -y && rm -rf /var/lib/apt/lists/*

WORKDIR /pandoc
USER $USERNAME
```

```
docker build -t <NAME> -f <DOCKERFILE>
```

CI-Pipeline (GitLab)

```
default:  
  image: eclipse-temurin:25-jdk  
  
job1:  
  stage: build  
  script:  
    - java -version  
    - javac Hello.java  
    - java Hello  
    - ls -lags
```

CI-Pipeline (GitHub)

```
name: demo
on:
  push:
    branches: [master]
  workflow_dispatch:

jobs:
  job1:
    runs-on: ubuntu-latest
    container: eclipse-temurin:25-jdk
    steps:
      - uses: actions/checkout@v7
      - run: java -version
      - run: javac Hello.java
      - run: java Hello
      - run: ls -lags
```

- Schlanke Virtualisierung mit Containern (kein eigenes OS)
- *Kein* echter Sandbox-Effekt
- Begriffe: Docker-File vs. Image vs. Container
- Ziehen von vordefinierten Images
- Definition eines eigenen Images
- Arbeiten mit Containern: lokal, CI/CD, VSCode ...
